BUS 310	D, Final	Exam	D,	Part	III,	Spring	2019
---------	----------	------	----	------	------	--------	------

Name	KEY	
Section	' '	

Instructions: This exam is in three parts: Part I is to be completed partly at home using the materials posted on Blackboard for Part I and you will answer questions about that work in class below; Part II is to be completed entirely in class using your computer. Part III is to be done entirely in class without your computer.

- 1. You may not use cell phones, and you may only access internet resources you are specifically directed to use: You may access your data file for Part I of the exam in Blackboard. You may access the data files posted to Blackboard for the Exam part II, but not for Part III.
- 2. It is a violation of the honor code to communicate with other students in or out of the class during the exam, by any means. Students whose exams show evidence of coordination will be reported.
- 3. Show all work to support your reasoning. Primarily, this can be done in Excel. Deletion of evidence of your logical process can result in loss of credit. A significant amount of credit goes toward process, reasoning and interpretation.
- 4. When rounding, do not over-round. In general, do not report dollar amounts beyond the penny. Means should be rounded to one digit more than the original data; standard deviations to two digits more. Do not report fractions rounded to single digit expressions: $\frac{131}{256} \neq \frac{1}{2}$, and do not round decimals or percents to a single digit: $0.57846 \dots \neq 60\%$ or 0.6. Report a minimum of two digits, up to four, unless otherwise specified in the problem.
- 5. If a problem asks for an explanation, state the solution clearly, then interpret or explain in addition to stating the solution, not in place of. Explanations without solutions, just as solutions without explanations, will not be awarded full credit.

Part I: At Home

This part was completed at home. You can upload the Excel file for Part I to the Part I folder in Blackboard for use during the Exam period. However, this submission will not be graded in this location, it must be submitted to the "to be graded folder" to receive credit.

Part II: In Class (with computer)

Before completing Part III, complete Part II in class. Return the paper to your instructor and put away your computer. Then pick up Part III.

Part III: In Class (without computer)

- 1. You may use a handheld calculator for this portion of the exam. Any calculator is fine, as long as it is not on a device that connects to the Internet. That means, you may not use the calculator on your phone or smart watch. You may also not share calculators with another student taking the exam at the same time.
- 2. This is Exam D.
- 3. Answer the questions on the paper exam. Sign the honor code statement on the next page.
- 4. Turn in your paper copy of the exam to your instructor. Your instructor will attach this portion of the exam to the version of Part II that you submitted previously.

					3
Honor Code Statement:					
I, Mason Honor Code and A	cademic Integrity PI	(print y	your name),	agree to abide	by the George
desire for greater academ	s among all member ic and personal achi	rs of the Georg evement, I, a	ge Mason Un student men	niversity Commu ober of the univ	inity and with the
pledge not to cheat, plagic read and I agree to follow to participate in the effort	arize, steal, or lie in t the guidelines laid o	<i>matters relate</i> out in the instr	ed to academ ructions for t	nic work. Furthe this exam above	ermore, I have
violations of the code, and	d will report such eff	orts in a timel	ly manner.	imes, or to assis	it in their
Student Signature and G#			.		Today's Date
					roday 3 Date

Part III:

When a hypothesis test is conducted, there are four possible combinations of outcomes: The
null can be true, the null can be false, our conclusion can agree with the true state of nature, or
it may not. A table of these situations is shown below. Two of these combinations are correct
and two produce errors. Label all four possibilities as correct, or, if an error, which kind of error
it is. (4 points)

Nature: Ho Frue

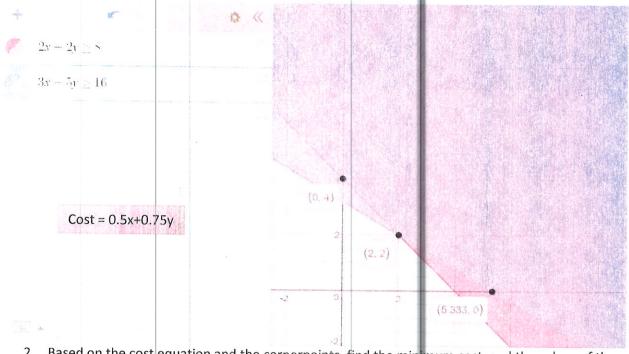

Connect

Type II.

Connect

Con

Below you will find the Desmos plot for the constraints for a linear programming problem. The graph shows the feasible region and its cornerpoints, the constraints graphed, and the cost function to be minimized. Not shown are the non-negativity constraints. Use this information to answer the questions that follow.

2. Based on the cost equation and the cornerpoints, find the minimum cost, and the values of the two variables produce this cost. (8 points)

$$0.5(0) + 0.75(4) = 3$$

 $0.5(2) + 0.75(2) = 2.5$ Minimum @ (2,2)
 $0.5(5.333) + 0.75(0) = 2.66$

Below you will find a boxplot and output for a two-sample t-test of two brands of light bulbs. Use this information to answer the questions that follow.

3. Based on the snapshot of the data, would you conclude that that the lightbulb data collected for the two brands are dependent or independent? (4 points)

independent

4. Based on your decision above, should you use the paired two-sample t-test, or the pooled (equal variance) two-sample t-test? (4 points)

pooled equal variance

5. If the company wants to know whether Brand 2 has a different lifespan than Brand 1, does that correspond to a one-tailed or two-tailed t-test (4 points)

2-tailed

6. State the null and alternative hypotheses, the test-statistic and p-value for the test described in the previous questions. State your conclusion in language a person not familiar with statistics can understand. (8 points)

Ho: M= M2

Ha: u, 7 uz

t= 0.7677

7. Based on the correlation table, which variable appears to be the best predictor of 30-year market averages? Explain your reasoning. (5 points)

The 10-year is best predictor highest cornelations

8. Why does it appear that the highest correlations for each variable on just off the diagonal? Why does this make sense in the real world? (6 points)

it means that generally the most recent behavior it best predictor y what comes next.

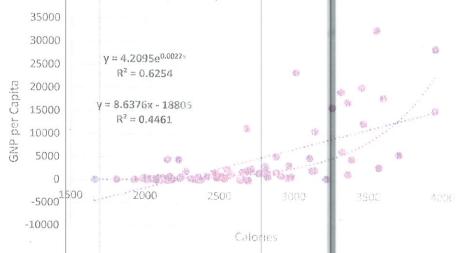

This makes sense

Use the data in the residual graphs, scatterplots, and regression output on the pages that follow to answer the remaining questions. Included elements are a snapshot sample of all available variables used in the complete model (the first regression output). Two more regression outputs are included: Calories vs. GNP per Capita as a linear model, and Calories vs. LN(GNP per Capital) which analyses the exponential model shown in the scatterplot. The residual plots correspond to the linear and log models for the last two regression outputs respectively.

	Α					
	A	В	C C	D	E	F

Calories (log) Residual Plot Calories Residual Plot 40000 Residuals 20000 -21500 2000 4000 -20000 2000 2500 3000 3500 4000 Calories Calories

GNP per Capita vs. Calories

9. Based on the first model containing all the variables, conduct a hypothesis test on the coefficient for Population Growth. State the null and alternative hypotheses, test-statistic and p-value. Does this test explain why the variable was removed from the final model? (8 points)

yes. while it could change as somables are removed, this p-value is guita Regh and so by paismony it's better to assume coefficients

10. Using the scatterplot, does the data appear to be linear or non-linear? (4 points)

the data appears to be either nonlinear or unequal variance the residual plot suggests nonlinear is more likely

11. Model 2 is the linear model, and Model 3 the non-linear model. In which model is the R^2 value higher? State the higher value. Does this confirm your answer from above? (4 points)

Model 3 higher $R^2 = 0.625$

12. In the third Model, what is the proportion of variability in GNP per capita can be explained by the relationship with Calories? (4 points)

62.5%

13. Use Model 2 to predict the GNP for capita of a country with a population growth rate of 0.7%, consumes 2200 calories per day, has a life expectancy of 74 years and a fertility rate of 1.2. If the variable does not appear in the model, ignore it. (6 points)

$$y = 8.638 \times -18.805$$

= 198.6

14. Construct a 95% prediction interval for the prediction above. You may use 1.96 as the multiplier for the prediction margin. (6 points)

margin of error/predictions 1.96# 5174.6 =
10,142.2

(-9943.6, 10,340.8)

15. Report the 99% confidence interval for the Calories coefficient from Model 1 (the full model). (4 points)

(1.544, 10.477)
